

Go from ink to text instantly

with **mimio** writingRecognition™

"Before mimio, [an assistant] was using a digital camera to photograph the whiteboard notes, then transcribing them so she could print and hand them out. With mimio, she just pushes a button to save everything, and another button to print. mimio is terrific!"

— Guerino D'Amato, Jr.
IT Customer Solutions Investigator, Advo

"mimio is great for meetings and presentations, because people don't have to take notes. Nothing gets lost. . . . Once you see mimio being used, it's easy to imagine its usefulness."

— Ilene Bierman, Senior Information
Center Consultant, Bulova Corporation

mimio® is the award-winning collaboration tool that works with your whiteboard to immediately improve the way you communicate. Simply attach mimio to any whiteboard, and everything you write or draw is seamlessly captured to your computer, in color and real time – ready to save, print, edit and share with anyone, anywhere in the world.

Convert handwritten notes into text.

mimio writingRecognition converts your handwritten whiteboard notes into ready-to-edit text, in seconds. Never again will anyone have to transcribe all those whiteboard notes into a text document.

After mimio captures your handwritten whiteboard or flip chart notes to your PC, writingRecognition converts them into ordinary text, ready to be saved, edited, e-mailed or dropped into a Windows® document. mimio writingRecognition takes note taking to the next level. If you've ever had to type the handwritten notes from a whiteboard or flip chart session, you need mimio with writingRecognition.

Standard writingRecognition features:

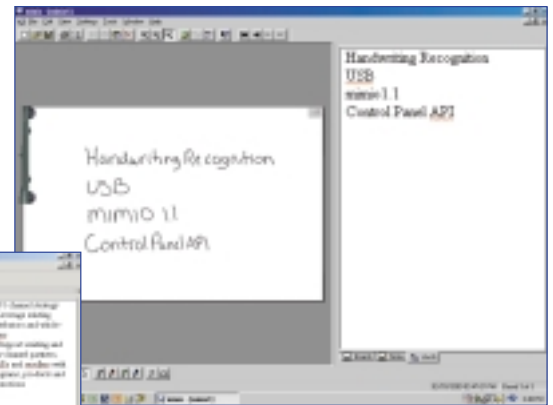

- Recognizes letters, numerals and punctuation in both print and cursive writing, on whiteboards or flip charts.
- Batch recognition saves time by converting multiple whiteboards — your entire session — from handwritten notes to text in just a few seconds.
- Two selection tools let you specify which notes to convert.
- Spell check helps you correct any misspelled words.
- Edit your text after it's transcribed, to correct any unclear or misspelled words.
- Distinguishes between similar characters like O and D, based on how they're written.
- Works with the English-language mimio (PC) you already own.

New text-ordering and selection features.

mimio writingRecognition 2.0 is more intuitive than ever. In this new release, notes are converted into text in the same order as they appear on the board, so even though "mimio 1.1" was written on the whiteboard after "Control Panel API", writingRecognition records the position of the new item and inserts it into the correct text location.

With writingRecognition, you can select handwritten notes with the regular (rectangular) selection tool or with a new lasso selection tool. The lasso selection tool allows you to choose exactly which letters, words or phrases you'd like to have converted to text — from a single letter to a large block of text.

No special training required.

The writingRecognition plug-in is very easy to use. Just install it on your PC with mimio for your whiteboard or mimio flipChart™, and begin writing with your mimio stylus. Use one of the two selection tools to choose the notes you'd like to convert into text, and writingRecognition does the rest. mimio writingRecognition uses CalliGrapher® from ParaGraph® to translate notes from print or cursive into standard text, ready for editing or formatting.

System requirements

Standard whiteboard equipped with English-language mimio, or flip chart easel pad equipped with mimio flipChart, PC with mimio software installed (version 1.11 or higher)

Learn more about these additional mimio products.

- mimio directPrint™: print directly from your whiteboard without a computer
